Background

Early recollections have been used both as an assessment and as a clinical tool. Therapists from a variety of approaches have emphasized the enduring nature of themes in early recollections. Recent studies confirm this enduring nature of themes in the telling of memories and past experiences (see Jesson, 2000; Singer & Bonakdare, 2010; Theme, Cutting, & Skaw, 1998). From a narrative perspective, clients’ stories are constructed and constantly re-edited in order to make sense of experiences. Early recollections can be seen as autobiographical stories told to make sense of the current self–narrative (Androutopoulou, 2013).

Aim

This narrative study explores common themes between clients’ specific early recollections and current-concern stories.

Method

Seven (7) clients’ written early recollections were analyzed using a thematic narrative analysis framework (Lieblich, Tavoil, Maschich, & Zilber, 1998; Resman, 2008) and were then compared to their case records and written self-characterizations following the triangulation method. Central common themes were “detected” by the exploration of word repetition and content commonalities with regards to the self, to others and to events. All data were collected during the first year of therapy.

Main Findings

Several common themes were “detected” among clients’ early recollections and current-concern stories as compared with their case records and written self-characterizations.

<table>
<thead>
<tr>
<th>Table 1. Themes in the Seven (7) Case Studies: Central and Secondary</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Central Theme</strong></td>
</tr>
</tbody>
</table>
| Client A. | Grieving self and others
| Client B. | Always being seen
| Client C. | Perfectionistic order
| Client D. | A lonely life-timer
| Client E. | “trapped in others’ will” |
| Client F. | Detailed narratives lacking exceptions
| Client G. | Body image issues and low self-esteem |

Discussion

These findings are in line with Androutopoulou (2013) who supported that central themes run across all self-narratives, including early recollections. “Detecting” these commonalities among early recollections and current-concern stories may be of therapeutic value in allowing clients to make better sense of their experiences and current difficulties, and in enhancing both a sense of continuity and change. Themes that are judged as “restricting” by clients and therapists can be more easily revised once their centrality and endurance is detected. Mosak and Di Pietro (2006) have provided extensive evidence that successful therapy outcomes are reflected in differences when re-telling recollections following treatment (see also Clark, 2002). These differences can be detected in both the form and content of early recollection narratives (Androutopoulou, 2013).

Acknowledgements

We thank A. Androutopoulou for the qualitative research advice and feedback and the Training and Research Institute for Systemic Psychotherapy Logo Psychias for all the support.

Making Sense of Current Difficulties: Thematic Analysis of Clients Early Recollections as Autobiographical Stories

Background
Postmodern therapists, including family-oriented and systemic therapists with an interest in narrative, often leave early recollections unexplored. “They may consider such work as either exclusively associated with individualistic and modernist approaches to therapy or as unavoidably involving a ‘high risk’ exercise in integration of modern and postmodern practices (Androutsopoulou, 2013, p. 314). However, as Efran & Clarfield (1992) have supported, it is the theoretical framework different techniques are associated with that should matter.

Early recollections have been used extensively both as an assessment and as a clinical tool, mostly in the adlerian tradition (Mosak and Di Pietro, 2006; Clark, 2002). Therapists from various approaches have emphasized the enduring nature of themes in early recollections.

Recent studies confirm this enduring nature of themes in the telling of memories and past experiences (see Josselson, 2000; Singer & Bonalume, 2010; Thorne, Cutting, & Skaw, 1998). From a narrative perspective, clients’ stories are constructed and constantly re-edited in order to make sense of experiences (Sarbin, 1986). Early recollections can be seen as autobiographical stories told to make sense of the current self-narrative (Androutsopoulou, 2013).

Aim
This narrative study explores common themes between clients’ specific early recollections and current-concern stories.

Method
The research team consisted of trainee therapists. The project was supervised as part of a course in qualitative research methods. Seven (7) clients’ written early recollections were analyzed using a thematic narrative analysis framework (Lieblich, Tuval, Maschiach, & Zilber, 1998; Riessman, 2008).

These were then triangulated with client records and written self-characterizations (Androutsopoulou, 2001) retrieved with therapists’ permission, who secured clients’ anonymity and consent.

Central common themes were ‘detected’ exploring word repetition and content commonalities regarding the self, others and events. All data were collected during the first year of therapy.
### Main Findings
Several common themes were detected among clients’ early recollections and current-concern stories (see Method).

Table 1. Themes in the seven (7) case studies: Central and secondary
Case Study Example: A lonely Life-Observer

(Client D, female, 30) (see Table 1)

*Quote from early recollections:*
“I am in kindergarten and while all the other children are playing together, I am walking around the playground alone. I am feeling ok. I am jealous of the other children playing together but at the same time I am too shy to join them. I am about 4 years old”.

*Quote from self-characterization:*
“… She is a girl with a quite sad look in her eyes, who observes with her eyes wide open whatever is going on around her. Her ears are wide open and she listens carefully to anything that is taking place around her, without talking very much. […] She is a lonely person”.

*Brief case history:*
- The client came to therapy feeling “invisible”.
- Lack of support from family led to issues of self-esteem and loneliness (father’s absence and mother’s mental illness).

**Discussion**

These findings are in line with Androutsopoulou (2013) who supported that central themes run across all self-narratives, including early recollections. Detecting theme commonalities among early recollections and current-concern stories may be of therapeutic value in allowing clients to make better sense of their experiences and current difficulties, and in enhancing both a sense of continuity and change. Themes that are judged as “restricting” by clients and therapists can be more easily revised once their centrality and endurance is detected. Mosak and Di Pietro (2006) have provided extensive evidence that successful therapy outcome is reflected in differences when re-telling recollections following treatment. These differences can be detected in both the form and content of early recollection narratives (Androutsopoulou, 2013). Further research would strengthen the above arguments.
